Title of project or programme

Maintaining mitochondrial health in Parkinson's disease: The role of PINK1 and Parkin

Source of funding information

National Health and Medical Research Council

Total sum awarded (Euro)

€ 373,463

Start date of award

01/01/2014

Total duration of award in years

4

Keywords Research Abstract

Parkinson's disease is a degenerative disorder of the central nervous system in which the underlying cause is mostly unknown. To pave the way to a better understanding of what goes wrong, this study will investigate the function of PINK1 and Parkin, two genes that are mutated in inherited forms of the disease that play important roles in maintaining cellular health. The results of this study will be used in exploring new therapeutic targets for the treatment of Parkinson's disease symptoms.
